Requirements for print and embroidery data

In screen printing, we usually work with environmentally friendly water-based inks from Virus and Bezema. We can realize designs in up to 8 separate colours for you. However, 1-4 colours per design are usually sufficient to realise great screen printing designs.

For screen printing, we need designs without colour blurring, that is one colour fading into another like e.g. on coloured photos. Designs with colour blurring we can realise for you using digital printing techniques.

Ideally, you send the data for multi-coloured screen printing designs already separated by colour. One level should be in black and white, as we need this to create the print films and screens.

Normally, the prices offered apply to prints up to 30 x 40 cm. For a surcharge, however, prints of up to 40 x 50 cm are also possible.

Data files for printing or embroidery are ideally already created for the desired print size and have a resolution of at least 300 dpi. Alternatively or additionally, it is best to provide us with scalable vector graphics in EPS format.

We can work with all common file formats but prefer to work with: EPS, PDF, PSD or AI.
